1.Component Diagram

2. Explanation

The website is the main part that users interact with. It contains three components: Authentication handles user login and authentication for shippers and carriers. Auction manages the freight marketplace, where shippers post loads and carriers submit bids. Payment handles payment-related operations after a bid is accepted and the load is completed.

The database stores the main information required by the system. It contains: Loads stores freight/load details posted by shippers. Bids stores bids submitted by carriers. Carriers provides carrier information and Shippers stores shipper information.

The Payment Gateway contains the escrowed payment component. Its purpose is to hold the payment securely until the required shipment is completed.
